

Training to Results

Charles Warloe | Bronco Entrepreneur Challenge | Early Stage | Service

Customer and buying trigger

The initial customer is an owner or operations leader at a business with about 50 employees, one HR generalist, and perhaps a recruiter or designated trainer, but no substantial training department. The buying trigger is one costly, recurring job-performance failure that existing training has not resolved. The business must have a subject matter expert and supervisor available to help define and test successful work.

Offer and delivery

Start with the highest-priority problem that is measurable and feasible to address. A diagnostic defines the required result and checks whether the cause is a skill gap, a process or tool problem, or another barrier. If training is appropriate, a separately scoped pilot combines expert knowledge, practice on real work, performance aids, and supervisor follow-up. AI can assist capture and drafting; the client expert validates accuracy and performance standards.

Benefits and measurement

The intended benefit is better job performance that helps protect or generate revenue, reduce rework, or free supervisor time. Agree a baseline, observable performance standard, and follow-up measure before building the intervention. Revenue or hiring outcomes require their own evidence; successful task completion is an intermediate result. Each engagement starts with one problem and can expand after results are reviewed.

Relevant results and experience

Charles Warloe holds a master's degree in Instructional Design and Technology and has corporate and military training experience. He reports designing a six-hour recruiting program whose initial six-person pilot used live requisitions: all six met the objective of sourcing five additional qualified candidates in a one-hour assessment. He also reports successful subsequent in-person and online delivery. At Doxa Painting, he worked with two founders to codify successful work and build interview assessments, competency checks, and training; a founder developed critical-skill job sheets and standards.

Business model and next validation

The pricing hypothesis is a \$1,450 diagnostic for one role and one problem, with implementation quoted separately. Alternatives include internal trainers, training platforms, and performance consultants. The proposed focus is hands-on implementation for a business with limited training capacity, informed by established training-transfer methods. Historical results are founder-reported, and the Doxa work was as an employee. Next: corroborate the case details, interview buyers near the target size, and scope one paid pilot.
